

Semantic Annotation Tool For EIS Publications

...using crowdsourcing, ontology and SPARQL

Team : A Q M Saiful Islam
Seyidov Mirsattar

What this tool about?

This tool is about annotating EIS related documents, which normally contain lots of **tabular** information.

- Annotate Tables
- Transform the table information into **Data cube** vocabulary
- Store data cube into to **virtuoso** server using SPARQL interface.

Poster

Start point

The image shows a web browser window displaying a research paper titled "Trace-based Just-in-Time Type Specialization for Dynamic Languages". The browser's address bar shows "Page: 1 of 14" and "100%". The paper's authors are listed as Andreas Gal^{*,+}, Brendan Eich^{*}, Mike Shaver^{*}, David Anderson^{*}, David Mandelin^{*}, Mohammad R. Haghighat^s, Blake Kaplan^{*}, Graydon Hoare^{*}, Boris Zbarsky^{*}, Jason Orendorff^{*}, Jesse Rudeman^{*}, Edwin Smith^{##}, Rick Reitmaier[#], Michael Bebenita⁺, Mason Chang^{+,#}, and Michael Franz⁺. The affiliations listed are Mozilla Corporation^{*}, Adobe Corporation^{*}, Intel Corporation^s, and University of California, Irvine⁺. The abstract discusses dynamic languages like JavaScript and the challenges of type specialization. The sidebar on the right contains a search interface with fields for "Subject", "Property", and "Object". It also has buttons for "Add annotation", "Show local sparql data", and "Find Similar". Below these buttons, two URLs are listed: "http://eis.iai.uni-bonn.de/semann/pdf/Ontological%20User%20Profiling.pdf" and "http://eis.iai.uni-bonn.de/semann/pdf/DBLP.pdf". Red callout boxes highlight specific features: "Running vocabulary suggestions via typeahead library" points to the "Property" field; "Loading and highlighting annotations" points to the "Object" field; "Storing of triples in Virtuoso" points to the "Add annotation" button; "Highlighting via Rangy library" points to the abstract text; and "Naive similar publications search based on existing annotations" points to the list of URLs.

Abstract

Dynamic languages such as JavaScript are more difficult to compile than statically typed ones. Since no concrete type information is available, traditional compilers need to emit generic code that can handle all possible type combinations at runtime. We present an alternative compilation technique for dynamically-typed languages that identifies frequently executed loop traces at run-time and then generates machine code on the fly that is specialized for the actual dynamic types occurring on each path through the loop. Our method provides cheap inter-procedural type specialization, and an elegant and efficient way of incrementally compiling lazily discovered alternative paths through nested loops. We have implemented a dynamic compiler for JavaScript based on our technique and we have measured speedups of 10x and more for certain benchmark programs.

Categories and Subject Descriptors D.3.4 [Programming Languages]: Processors — Incremental compilers, code generation.

General Terms Design, Experimentation, Measurement, Performance.

Keywords JavaScript, just-in-time compilation, trace trees.

and is used for the application logic of browser-based productivity applications such as Google Mail, Google Docs and Zimbra Collaboration Suite. In this domain, in order to provide a fluid user experience and enable a new generation of applications, virtual machines must provide a low startup time and high performance.

Compilers for statically typed languages rely on type information to generate efficient machine code. In a dynamically typed programming language such as JavaScript, the types of expressions may vary at runtime. This means that the compiler can no longer easily transform operations into machine instructions that operate on one specific type. Without exact type information, the compiler must emit slower generalized machine code that can deal with all potential type combinations. While compile-time static type inference might be able to gather type information to generate optimized machine code, traditional static analysis is very expensive and hence not well suited for the highly interactive environment of a web browser.

We present a trace-based compilation technique for dynamic languages that reconciles speed of compilation with excellent performance of the generated machine code. Our system uses a mixed-mode execution approach: the system starts running JavaScript in a fast-starting bytecode interpreter. As the program runs, the system

Subject

Unit Test Result

EIS Table Annotation :: Unit Test

☐ Hide passed tests ☐ Check for Globals ☐ No try-catch

Mozilla/5.0 (Macintosh; Intel Mac OS X 10.8; rv:32.0) Gecko/20100101 Firefox/32.0

Tests completed in 3722 milliseconds.
16 assertions of 16 passed, 0 failed.

1. **Sparql Unit Test for our EIS Lab: Sparql Server Url Validity** (0, 1, 1) [Rerun](#)

2. **Sparql Unit Test for our EIS Lab: Camel Case test** (0, 2, 2) [Rerun](#)

3. **User table selection testing: Testing user selected items validation** (0, 5, 5) [Rerun](#)

1. Table range successfully calculated
2. No table suggestion applied here
3. Same number of element is found after the validation
4. First item match of the selected elements after validation
5. Last item match of the selected elements after validation

4. **User table selection testing: Testing user selected parse data** (0, 3, 3) [Rerun](#)

5. **DataCube testing: Testing Dimension and property insertion** (0, 1, 1) [Rerun](#)

6. **DataCube testing: Testing Data set insertion** (0, 1, 1) [Rerun](#)

7. **DataCube testing: Testing observation insertion** (0, 1, 1) [Rerun](#)

8. **DataCube testing: Testing column header insertion** (0, 1, 1) [Rerun](#)

1. Column header successfully inserted

9. **DataCube testing: Cleaning up the test database** (0, 1, 1) [Rerun](#)

Demo

Issues & limitations (Demo)

Implemented Features

- Extend the implementation from **text to table** annotation
- Introduces **suggest** selection mechanism
- **Accommodate** the GUI for new implementation
- Add a application **set up script** when the application run first time
- Extend our **wiki** doc to support **Mac** and **Ubuntu** installation.

Lessons learn

- PDF.js is not developer friendly, it has **limited** access over PDF documents.
- Get support from Virtuoso to enable Cross-origin resource sharing (**CORS**).
- JavaScript test unit (**QUnit**) is different then normal programming language unit test.
- Making the **Poster** was an interesting experience.
- Handling a **team** in this lab is very different/difficult then in real world professional environment.

Future work

- I will continue working on it as part of my thesis.
- We addressed some issues here, will continue working on them.
- Put it on the web for public use.
- Will collect the user feedbacks and consider constructive suggestions.

Thanks for your time
