

User Manual:

Working with Persian sentiment analysis web service is very easy . You can get to the text sentiment you want by these two ways:

1. Use our Demo page from this address in local host sever in EIS virtual machine:
<http://localhost/sentiment/demo.php>
2. Send a http request to local host without any username and password and with parameter

“text” : <http://localhost:8080/PersianSentiment/services/Sentiment?wsdl>

This is the php code for this method>>

```
$soapClient = new SoapClient("http://localhost:8080/PersianSentiment/services/Sentiment?wsdl");

// Prepare SoapHeader parameters
$sh_param = array(
    'Username' => "",
    'Password' => "");
$headers = new SoapHeader('http://localhost:8080/PersianSentiment/services/Sentiment',
'UserCredentials', $sh_param);

// Prepare Soap Client
$soapClient->__setSoapHeaders(array($headers));

// Setup the RemoteFunction parameters

$ap_param = array(
    'text' => $txt);

// Call RemoteFunction ()
$error = 0;
try {
    $info = $soapClient->__call("persian_sentiment", array($ap_param));
} catch (SoapFault $fault) {
    $error = 1;
    print("
        alert('Sorry, blah returned the following ERROR: ".$fault->faultcode."-".$fault->faultstring.".
        We will now take you back to our home page.');
```
